Searches run against the **Published_Applications** AA database on any Compugen machine between Feb 18 – Mar 16, 2004 had incomplete results.

The incomplete results were due to problem with the program that moves new applications into the Published_Applications_AA database. This problem was detected and corrected on Mar 17, 2004.

We have determined that a search was done for you on case in the Published_Applications_AA database between Feb 18 – Mar 16, 2004. This search has been rerun. The new results are attached.

NBD peptide SEQ ID NO 19.

```
differentiation. The compound is useful in treating Userconsist of the compound is useful in treating Userconsist conditions, where the condition is an inflammatory disorder, an autoimmune disease, transplant rejection, osceoporosis, cancer, Alzheimer's disease, atherosclerosis, a viral infection or ataxia telangiectasia. The inflammatory disorder is asthma, allergies, urticaria, anaphylaxis, categorathitis, postiatio, sepsies, psoriatis, inflammatory bowel disease, chronic obstructive pulmonary disease, vasculitis and burstitis. The inflammatory disorder may also be dermatitis, eczema, psoriasis, osteoarthritis, psoriatic arthritis, lupus and spondylarthritis, also for Crohn's disease, ulcerative colitis, polymylalgia, scleroderma, Wagner's granulomatosis, temporal arteritis, croyoglobulinaemia or multiple sclerosis. For chronic viral infections caused by Epstein-barr, cytomegalovirus or herpes simplex. Other viral diseases include HIV and infiluenza. The compound may also be useful for treating anaphylaxis, dury and food sensitivity, contact dermatitis, unburn or aging. The compound may be used to replace corticosteroids in munosurnorsesion in transplant and cancer therever.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               immunosuppression in transplants and cancer therapy. Also for identifying antiinflammatory compounds and for diagnosis of an inflammatory disorder. The compound may be administered alone or in combination with other known anti-inflammatory agents. The present sequence is that of a mutated NEMO binding domain of IKKbeta.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               invention relates to modulating NF-kappaB (NF-kB) induction in a cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Modulating NF-kappaB induction in a cell, useful for treating e.g. inflammatory disorders, osteoporosis and cancer, comprises contacting a cell with an anti-inflammatory compound comprising at least one NEMO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             comprises contacting a cell with an anti-inflammatory compound (ABB08725-ABB08742) comprising at least one NEMO binding domain (ABB77313). The compound has acts through selective inhibition of cytokine-mediated NF-kB activation by blocking the interaction of NEMO with IKKDeta at the NEMO binding domain. Blockage of IKKDeta-NEMO interaction results in inhibition of IKKDeta kinase activation and subsequent decreased phosphorylation of IkKDeta kinase activation and act (directly or indirectly) by blocking the recruitment of leukocytes into sites of acute and chronic inflammation, by down-regulating the expression of E-selectin on leukocytes or by blocking osteoclast
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Claim 23; Fig 5; 82pp; English.
                                                                                               02-MAY-2001; 2001WO-US40654.

AMA 8620-AAAM 8645), comprising a membrane translocation domain (AAA48620-AAAM 8645), comprising a membrane translocation domain (AAA48620-AAAM 862) ro AAAM 8651) which comprises from 6-15 amino acid residues, fused to a NEWO binding sequence (AAA48619). The antiinflammatory compounds have antiasthmatic, antipacterial, immunosuppressive, dermatological, neuroprotective, cartibacterial, immunosuppressive, dermatological, neuroprotective, noctropic, antiatheroscleresive, dermatological, neuroprotective, notropic, antiatheroscleresive, dermatological, neuroprotective, noctropic, antiatheroscleresive, dermatological, neuroprotective, noctropic, antiatheroscleresive, dermatological, neuroprotective, notropic, antiatheroscleresive, dermatological, neuroprotective, notropic, antiatheroscleresive, dirangless kinase beta (IKKObeta) at the NEWO binding domain that results in inhibition of IKAOpea (IKKOpeta) at the NEWO binding domain that results in inhibition of IKAOpea The compounds are useful for treating inflammation or cancer, psoriasis, rheumatoid arthritis, unglammatory bowel disease, sepsis, vasculitis, osteoarthritis, inflammatory bowel disease, sepsis, vasculitis, granulomatosis, multiple sclerosis; transplant rejection; osteoporosis; transplants scleroderma, profit inflammatory resonness such as allowed, if treating profit in franting anaphylaxis and ataxia anaphylaxis, profit in the anaphylaxis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                             Antiinflammatory; antiasthmatic; cytostatic; antipsoriatic; nootropic; antirheumatic; antiarthritic; osteopathic; antibacterial; virucide; immunosuppressive; dermatological; neuroprotective; antiatheroscalerotic; antiallergic; membrane translocation domain; NEWO binding domain; eczema; cytokine; NFkappaB; IkappaB kinase beta; IKKbeta; cancer; psoriasis; rheumatoid arthritis; osteoarthritis; inflammatory bowel disease; autoimmune disorder; multiple sclerosis; transplant rejection; osteoporosis; Alzheimer's disease; atherosclerosis; viral infection; ataxia telangiectasia; allergy; anaphylaxis; arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel antiinflammatory compound comprising membrane translocation domain fused to NEMO binding sequence, useful for blocking nuclear factor kappaB activation, and for treating asthma, lung inflammation,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 pro-inflammatory responses such as allergies, urticaria, anaphylaxis, drug or food sensitivity, eczema, dermatitis, sunburn, aging and

```
Human; antiinflammatory compound; NEMO binding domain; NBD; IKKbeta; IkappaB kinase-beta; IkappaB kinase-alpha; IKKalpha; NF-kappaB; nuclear factor-kappaB induction; inflammatory disorder; autoimmune disease; osteoporosis; cancer; Alzheimer's disease; atherosclerosis; viral infection; Ataxia telangiectasia; transplantation detection; immunosuppressive; osteopathic; cytoetatic; nootropic; neuroprotective; antiatherosclerotic; virucide; vasotropic; antirheumatic; antiatheritic; mutant; mutein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel antiinflammatory peptide compounds comprising NEMO binding domain, useful for modulating NF-kappaB induction in a cell and for treating NF-kappaB-mediated inflammation disorders e.g., asthma,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                telangiectasia, and for transplantation detection. The compounds of the invention block NF-kappaB induction by IKK but do not inhibit the basal activity of NF-kappaB. The present sequence represents a human mutant NBD peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Length 28;

The invention relates to modulating NF-kappaB (NF-kB) induction in a cell comprises contacting a cell with an anti-inflammatory compound (ABB008725-ABB08725) comprising at least one NEMO binding domain (ABB07313). The compound has acts through selective inhibition of (ABB07313). The compound has acts through selective inhibition of cytokine-mediated NF-kB activation by blocking the interaction of NEMO interaction results in inhibition of IKADpaB. The compound may also act (directly or indirectly) by blocking the recruitment of Leukocytes into sites of acute and chronic inflammation, by blocking the recruitment of Leukocytes into sites of acute and chronic inflammation, by blocking osteoclast of Eselection on leukocytes or by blocking osteoclast of differentiation. The compound is useful in treating osteoclast conditions, where the condition is an inflammatory disorder. an autoimmune disease, transplant rejection, osteoprosis, cancer, Alzheimer's disease, atheroscolerosis, a viral infection or ataxia telangiectasia. The inflammatory disorder may also be dermatitis, inflammatory disorder may also be dermatitis, eczema, bowel disease, chronic obstructive pulmonary disease, vasculitis and bursitis. The inflammatory disorder may also be dermatitis, coloriasis, osteoarthritis, psociatic arthritis, luque and bursitis. The inflammatory disease, ulcerative colitis, polymyalgia, scleroderma, Wegner's granulomatosis, temporal arteritis, polymyalgia, scleroderma, Wegner's granulomatosis, temporal arteritis, polymyalgia, scleroderma, Wegner's granulomatosis, temporal arteritis, cursed by Epstein-barr, cytomegalovirus or herpes simplex. Other craning anaphylaxis, drug and food sensitivity, contact dermatitis, any application in which controcercine to replace corticosteroids in munuosuppression in transplants and cancer therapy. Also for identifying immunosuppression in transplants and cancer therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Claim 23; Fig 5; 82pp; English.

compounds are useful for treating inflammatory disorders, e.g. asthma, lung inflammation or cancer, psoriasis, rheumatoid arthritis, osteoarthritis, inflammatory bowel disease, seppis, vasculitis, bursitis, autoimmune diseases such as lupus, polymyalgia, scleroderma, granulomatosis, multiple sclerosis, transplant rejection; osteoporosis, Alzheimer's disease; atherosclerosis, viral infections, and ataxia relangiectasia. The compounds are also useful for treating pro-inflammatory responses such as allergies, urticaria, anaphylaxis, drug or food sensitivity, eczema, dermatitis, sunburn, aging and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; antiinflammatory compound; NEMO binding domain; NBD; IKKbeta; IkappaB kinase-alpha; IKKalpha; NF-kappaB; nuclear factor-kappaB linduction; inflammatory disorder; autoimmune disease; osteoporosis; cancer; Alzheimer's disease; atherosclerosis; viral infection; Ataxia telangiectasia; transplantation detection; immunosuppressive; osteopathic; cytostatic; nootropic; neuroprotective; antiatherosclerosic; virucide; vasotropic; antirheumatic; antiathritic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to antiinflammatory compounds comprising NEMO binding domain (NBD) peptides. The NEMO binding domains are found on IkappaB kinase-beta (IKKbeta) and IkappaB kinase-alpha (IKKalpha) proteins. The antiinflammatory compounds of the invention are useful for modulating nuclear factor kappaB (NF-kappaB) induction in a cell, where the compounds are capable of blocking the interaction between one or more IKKs such as IKKalpha or IKKbeta, and NEMO. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel antiinflammatory peptide compounds comprising NEMO binding domain, useful for modulating NF-kappaB induction in a cell and for treating NF-kappaB-mediated inflammation disorders e.g., asthma,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to novel peptide modulators of androgen receptor. The peptides of the invention are useful for treating androgen-associated disorders such as prostate cancer, particularly hormonally refractive prostate cancer, colon cancer, lung cancer, benign prostatic hypertrophy, acne, hirsutism, male pattern baldness, Stein-Leventhal syndrome, androgen insensitivity syndrome, infertility, endometrial cancer and X-linked spinal bulbar muscular atrophy. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Androgen receptor; androgen-associated disorder; prostate cancer; acne; benign prostatic hypertrophy; hirsutism; androgen insensitivity syndrome; male pattern baldness; Stein-Leventhal syndrome; infertility; cytostatic; X-linked spinal bulbar muscular atrophy; antiseborrheic; dermatological; depilatory; androgen receptor binding peptide.
                                                                                                                                                                                                                       Gaps
antiinflammatory compound further comprises at least one membrane translocation domain. The compounds are useful for treating inflammatory disorders, autoimmune diseases, osteoporosis, cancer, Alzhelmer's disease, atherosclerosis, viral infections, Ataxia telanglectasia, and for transplantation detection. The compounds of the invention block NF-kappaB induction by IKK but do not inhibit the basal activity of NF-kappaB. The present sequence represents an antinflammatory compound of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New peptide modulators of androgen receptor, useful for treating androgen-associated disorder, e.g. prostate cancer, particularly hormonally refractive prostate cancer, colon cancer, lung cancer,

A fusion peptide (II) containing (I) and at least a membrane translocation sequence is useful for down regulating endothelial nitric oxide synthase (eNOS) activity in a cell, resulting in blockage of vasodilation. (II) is therefore useful for inhibiting inflammation and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              chronic inflammatory bowel disease; tumour growth; malignant neoplasm;

tumour cell angiogenesis/proliferation in an animal; and for blocking the interaction of caveolin with a protein in vivo. (II) may be useful in treatment of inflammatory conditions such as osteoporosis, rheumatoid arthritis, atherosclerosis, asthma and Alzheimer's disease. (I) and (II) are also useful for treating pathological processes associated with a pro-inflammatory response including allergies such as allergic rhinitis, cuticaria, anaphylaxis, dry sensitivity, food sensitivity, cutaneous inflammatory response including allergies such as allergic rhinitis, cuticaria, anaphylaxis, dry sensitivity, food sensitivity, cutaneous inflammation such as dermatitis, eccema, psoriatic arthritis, submurn, aging, arthritis, and chronic obstruction pulmonary disease and chronic inflammatory bowel disease. (I) and (II) are useful for immunosuppression in transplant and cancer patients. When administered along with one or more antinflammatory conticosteroids useful for immunosuppression in transplant and cancer patients. Mhen administered along with one or more antinflammatory captured (II) and (II) are useful for inhibiting tumour growth or malignant neoplasm including cellular angiogenetics, proliferation, invasiveness, and metastasis in biological systems. This sequence represents a fusion intransplant internaphedia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Alpha smooth muscle actin; alpha-SM; wound contraction; hypertrophic scar; fibromatosis; Dupuytren disease; fibrotic condition; lung fibrosis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  g
```

The present invention relates to novel peptides comprising of a specific

Claim 7; Page 23; 31pp; English.

ţ

A peptidic product for prevention and treatment of a disease related alpha-SM actin expression comprises a tetrapeptide associated with a chemical entity that is able to introduce the tetrapeptide into the

```
tetrapeptide associated with an oligopeptide which allows the introduction of the tetrapeptide into the target cell. The present sequence is one such peptide. Residues 1 to 4 of the present sequence correspond to the specific tetrapeptide, while residues 5 to 20 correspond to the specific tetrapeptide, while residues 5 to 20 correspond to the oligopeptide. The specific tetrapeptide of the present sequence interferes with alpha smooth muscle (alpha-SM) actin organisation in stress fibers. The present sequence may be used in the prevention and/or treatment of a disease related to alpha-SM actin expression, e.g. wound contraction, hypertrophic scars, fibromatosis and fibrotic conditions. The present sequence may also be used to treat
                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence is a cell permeable anti-apoptotic protein blocking peptide, which can be used to inhibit tumour growth, e.g. by ex vivo purging or (after stablihsation) in vivo administration. The peptide preferably blocks Bcl-2, and comprises a signal peptide mediating cell penetration and a functional sequence corresponding to a Bcl-2 domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Cell permeable, apoptotosis; blocking; inhibition; tumour growth; ex vivo purging; in vivo administration; Bcl-2.
                                                                                                                                                                                                                                                     ö

The present invention relates to peptides capable of interacting with a smad protein, comprising a Smad Interaction Motif (SIM; amino acid sequence PP(TN)K). The present sequence is one such Smad interacting peptide. Smad proteins are a family of highly conserved, intracellular proteins that signal cellular responses downstream of Transforming Growth Factor-beta (TGF-beta) family serine/threonine kinase receptors. The SIM is thought to be necessary for interaction with the MH2 domain of Smad2. The peptides of the present invention are useful in the manufacture of a medicament for the treatment of a patient in need of modulation of activin or TGF-beta signalling; cancer; a patient in need of reducing extracellular matrix deposition, encouraging tissue repair and/or regeneration, tissue remodelling or healing of a wound, injury or surgery, or reducing scar tissue formation arising from injury to the surgery or reducing scar tissue formation arising from injury to the carin; a patient with or at risk of end-stage organ failure, pathologic extracellular matrix accumulation, a fibrotic condition, disease states associated with immunosuppression (such as different forms of malignancy, and the immunosuppression (such as different forms of malignancy).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                growth, kidney damage (for e.g. obstructive neuropathy, IgA nephropathy
or non-inflammatory renal disease) or renal fibrosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Polypeptide capable of interacting with a Smad polypeptide, useful in the treatment of cancer and for tissue remodelling or healing of a wound, injury or surgery, comprises a Smad Interaction Motif and is

The present invention relates to peptides capable of interacting with a Smad protein, comprising a Smad Interaction Motif (SIM; amino acid sequence is one such Smad interacting peptide. Smad proteins are a family of highly conserved, intraccillular proteins that signal cellular responses downstream of Transforming Growth reacher. Factor-beta (TGF-beta) family serine/fureconine Kinase receptors. The SIM is thought to be necessary for interaction with the MH2 domain of Smad2. The peptides of the present invention are useful in the manufacture of a medicament for the treatment of a patient in need of modulation of activin or TGF-beta signalling; cancer; a patient in need of modulation of extracellular matrix deposition, encouraging tissue repair and/or regeneration, tissue remodelling or healing of a wound, injury or surgery, or reducing scar tissue formation arising from injury or brain; a patient with or at risk of end-stage organ failure, pathologic extracellular matrix accumulation, a fibrotic condition, disease states associated with immunosuppression (such as different forms of malignancy, chronic degenerative diseases, and AIDS), diabetic nephropathy, tumour growth, kidney damage (for e.g. obstructive neuropathy, 1gA nephropathy

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This sequence represents a specifically claimed peptide of the formula: V-(AA1)n-Cys(V')-(AA2)m-V' (1), in which n and m = 0-5, totalling 2-5; if n = 1, AA1 = Ala; if n = 2, (AA1)n = Gln-Ala; and if n = 3 or more, (AA1)n = (X)p-Gln-Ala; X = and main of acid; p = 1-3, depending on value of n; if m = 1, AA2 = Arg; if m = 2, (AA2)n = Arg-Gly; if m = 3 or more, (AA2)n = Arg-Gly-(X)q; q = 1-3, depending on value of m; V, V' and V'', and v' or a specific cell. The peptides are inhibitors of cysteine proteases, specifically interleukin-1 beta converting enzyme (ICE). They inhibit death of cells, particularly in humans, and can be used to treat neurodegenerative diseases (e.g. ageing) Alzheimer's, Machado-Joseph, Parkinson's or Huntington's diseases, multiple sclerosis, muscular dystrophy, stroke), cardiovascular disease and liver disorders.
                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  lystrophy, stroke), cardiovascular disease and liver disorders.
The peptides should be more specific than pseudosubstrate inhibitors.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes a composition comprising an isolated oestrogen receptor activity inhibiting (anti-oestrogen) peptide. The peptides used in the composition comprise sequences of human oestrogen receptor (OR) surrounding Tyr537 and steroid receptor co-activator-1 (SCR-1). The peptide compositions, nucleic acids and vectors of the present invention can reduce OR activity in a cell, reduced OR polypeptide dimerisation in a cell and reduce the binding of SRC-1 polypeptide to an OR polypeptide dimer in a cell. They can be used for killing cancer cells and treating cancers, particularly breast cancer. The present sequence represents a specifically claimed anti-oestrogen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New anti-oestrogen peptide compositions - comprise sequences based on oestrogen receptor and steroid receptor co-activator-1 sequences, used for treating cancers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ..

The present sequence is that of a fusion protein comprising an Antennapedia peptide and a mouse Toll/interleukin-1 receptor adapter protein (TRAP) inhibitor polypeptide (see ABPSB106) of the invention. Antennapedia, derived from Drosophila, is a cellular membrane transport protein and can be used to deliver the TIRAP inhibitor across the cell membrane so that it becomes the rappentically active within the cell membrane so that it becomes component signalling in response to TIRA ligation, and controls independent signalling in response to TIRA ligation, and controls dendritic cell meturation. Characterisation of TIRAP has led to the discovery of compounds that inhibit both the MyD88 independent pathway as well as the MyD88 dependent pathway of TIRAP by inhibiting TIRAP polypeptide emplaised signalling. Compounds that inhibit TIRAP activity are useful for preventing or reducing inflammation and septic shock, and especially for assisting in the prevention of graft rejection, which occurs, at least in part, because of cellular necrosis induced inflammation. The invention provides TIRAP inhibitor polypuctides (see ABPSB105-08). The TIRAP inhibit companies can inhibit both the MyD88 independent response in cells and mapp kinases, and the MyD88 dependent response in cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New toll/interleukin-1 receptor adapter protein (TIRAP) polynucleotides and polypeptides, useful for treating a disease state associated with TIRAP expression, e.g. inflammation, and for inducing and affecting immune response
                                                                                                                                                                                                                     Toll/interleukin-1 receptor adapter protein; TIRAP; mouse; inhibitor; Antennapedia; antiinflammatory.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1..16

                                                                                                                                                                                                                            The invention relates to modulating NP-kappaB (NF-kB) induction in a cell comprises contacting a cell with an anti-inflammatory compound (C (ABB00725-ABB00742) comprising at least one NBMO binding domain (ABB77313). The compound has acts through selective inhibition of C cytokine-mediated NF-kB activation by blocking the interaction of NEMO binding domain. Blockage of IKKbeta-NEMO interaction results in inhibition of IKKbeta kinase activation and subsequent decreased phosphorylation of IKKbeta Fre compound may also into sites of acute and chronic inflammation, by down-regulating the expression of E-selectin on leukocytes or by blocking osteoclast conditions, where the condition is an inflammatory disorder, an autoimmune disease, transplant rejection, osteoporosis, cancer, an autoimmune disease, atherosclerosis, a viral infection or ataxia conditions, where the condition is an inflammatory disorder, an autoimmune disease, atherosclerosis, a viral infection or ataxia curticaria, anaphylaxis, cutaneous inflammaton, sepsis, psoriasis, curticaria, anaphylaxis, cutaneous inflammation, sepsis, psoriasis, cremandidesse, rhenitis, psoriatic arthritis, osteoarthritis, psoriatic arthritis, used arthritis, osteoarthritis, psoriatic arthritis, lupus and boursitis. The inflammatory disorder may also be dermatitis, eczema, psoriatis, osteoarthritis, psoriatic arthritis, lupus and psoriasis, osteoarthritis, soriacis are also dermatitis, conditions applyatic arthritis, drug and food sensitivity, contact dermatitis, cryoglobulinaemia or multiple sclerosis. For chronic viral infections cryoglobulinaemia or multiple sclerosis. For chronic viral infections cryoglobulinaemia or multiple sclerosis. For chronic cryoglobulinaemia or multiple sclerosis. For chronic viral infections creating anaphylaxis, drug and food sensitivity, contact dermatitis, any may any any and inferior cryoglobulinaemia or multiple aclerosis. For chronic viral infections craesing anaphylaxis, drug and chronic and conticosteroids in minhibard and inferior and co
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  immunosuppression in transplants and cancer therapy. Also for identifying antiinflammatory compounds and for diagnosis of an inflammatory disorder. The compound may be administered alone or in combination with other known anti-inflammatory agents. The present sequence is that of the NEWO binding domain of IKKDeta.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Antiinflammatory; antiasthmatic; cytostatic; antipsoriatic; nootropic; antitheumatic; antiatchritic; osteopathic; antibacterial; virucide; immunosuppressive; dermatological; neuroprotective; antiatherosclerotic; antiallergic; membrane translocation domain; NEMO binding domain; eczema;

                                                                                                                                                                                                                                                                                                                                                                                                                                             amino acid residues, fused to a NEMO binding sequence (AAM48619). The antiinflammatory compounds have antiasthmatic, cytostatic, antipsoriatic, antinheumatic, antiartheumatic, antiartheumatic, antiartheumatic, osciptus antibacterial, immunosuppressive, dermacological, neuroprotective, nootropic, antiatherosclerotic, virucide and antiallergic activity. The compounds act as selective inhibitors of cytokine-mediated NFkappaB activation by blocking interaction of IkappaB kinase beta (IKKbeta) at the NEMO binding domain that results in inhibition of IKKbeta kinase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       activation and subsequent decreased phosphorylation of IkappaB. The compounds are useful for treating inflammatory disorders, e.g. asthma, lung inflammation or cancer, psoriasis, rheumatorid arthritis, osteoarthritis, inflammatory bowel disease, sepsis, vasculitis, bursitis, autoimmune diseases such as lupus, polymyalgia, scleroderma, granulomatosis, multiple sclerosis; transplant rejection; osteoporosis; Alzhaimer's disease; atherosclerosis; viral infections; and ataxia relangiectasia. The compounds are also useful for treating pro-inflammatory responses such as allergies, urticaria, anaphylaxis, drug or food sensitivity, eczema, dermatitis, sunburn, aging and
Novel antiinflammatory compound comprising membrane translocation domain fused to NEMO binding sequence, useful for blocking nuclear factor kappaB activation, and for treating asthma, lung inflammation,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                    The invention relates to an antiinflammatory compound (especially AAM48628-AAM48645), comprising a membrane translocation domain (AAM48620-AMM48627) or AAM48646-AAM48651) which comprises from 6-15
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Length 28;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Indels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         100.0%; Score 162; DB 23;

NEWO binding domain (NBD) peptides. The NEWO binding domains are found on IkappaB kinase-beta (IKKbeta) and IkappaB kinase-lapha (IKKalpha) proteins. The antiinflammatory compounds of the invention are useful for modulating nuclear factor-kappaB (NF-kappaB) induction in a cell, where the compounds are capable of blocking the interaction between one or more IKKs such as IKKalpha or IKKbeta, and NEMO. The antiinflammatory compound further comprises at least one membrane translocation domain. The compounds are useful for treating inflammatory disorders, autoimmune diseases, osteoporosis, cancer, Alzheimer's disease, atherosclerosis, viral infections, Ataxia telanglactasia, and for transplantation detection. The compounds the invention block NF-kappaB induction by IKK but do not inhibit

The invention relates to modulating NF-kappaB (NF-kB) induction in a cell comprises contacting a cell with an anti-inflammatory compound (ABB077313). The comprision at least one NEMO binding domain (ABB077313). The compound has acts through selective inhibition of cytokine-mediated NF-kB activation by blocking the interaction of NEMO cytokine-mediated NF-kB activation by blocking the interaction of NEMO binding domain. Blockage of IKKDeta-NEMO interaction results in inhibition of IKCDeta kinase activation and subsequent decreased phosphorylation of IKCDETA kinase activation and subsequent decreased phosphorylation of IKCDETA kinase activation and subsequent decreased phosphorylation of IKCDETA kinase activation and correction conformed in the selection of Eselection on leukocytes or by blocking osteoclast confideration. The compound is useful in treating NF-kB mediated confitient in the compound is useful in treating NF-kB mediated confitient in the inflammatory disorder is an inflammatory disorder. Alzheimer's disease, transplant rejection, osteoporosis, cancer, at the inflammatory disorder is asthma, allergies, uriticaria, anaphylaxis, cutaneous inflammation, sepasis, psoriasis, chematorial confit of the inflammatory disorder is asthma, allergies, uriticaria, anaphylaxis, cutaneous inflammation, sepasis, psoriasis, osteoarthritis, psoriatic arthritis, inflammatory disorder may also be dermatitis, concomposition or psoriasis, osteoarthritis, psoriatic arthritis, lupus and sporial infections of psoriasis, celevathritis, psoriatic arthritis, lupus and sporial sporial sporial arteritis, cryoglobulinaenia or multiple sclerosis, concomposis, temporal arteritis, cryoglobulinaenia or multiple sclerosis. For chronic or infinity or colitis, cryoglobulinaenia or multiple sclerosis. caused by Epstein-barr, cytomegalovirus or herpes simplex. Other viral diseases include HIV and influenza. The compound may also be useful for treating anaphylaxis, drug and food sensitivity, contact dermatitis, sunburn or aging. The compound may be used to replace corticosteroids in any application in which corticosteroids are used, including immunosuppression in transplants and cancer therapy. Also for identifying antiinflammatory compounds and for diagnosis of an inflammatory disorder.

```
ö
The compound may be administered alone or in combination with other known anti-inflammatory agents. The present sequence is that of a mutated NEMO binding domain of IKKDeta.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Antinflammatory; antiasthmatic; cytostatic; antipsoriatic; nootropic; antirheumatic; antiarthritic; osteopathic; antibacterial; virucide; immunosuppressive; dermatological; neuroprotective; antiatherosclerotic; antiallergic; membrane translocation domain; NEWO binding domain; eczema; cytokine; NFkappaB; IkappaB kinase beta; IKKbeta; cancer; psoriasis; riheumatoid arthritis; osteoarthritis; inflammatory bowel disease; autoimmune disorder; multiple sclerosis; transplant rejection; osteoporosis; Alzheimer's disease; atherosclerosis; viral infection; ataxia telangiectasia; allergy; anaphylaxis; arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                amino acid residues, tused to a NEMO binding sequence (AAM48619). The antiinflammatory compounds have antiasthmatic, cytostatic, antibsoriatic, antirheumatic, antiarthritic, osteopathic, antiabacterial, immunosuppressive, dermatclogical, neuroprotective, nootropic, antiatherosclerotic, virucide and antiallergic activity. The compounds act as selective inhibitors of cytokine-mediated NFkappaB activation by blocking interaction of IkappaB kinase beta (IKKbeta) at the NEMO binding domain that results in inhibition of IKKbeta kinase activation and subsequent decreased phosphorylation of Ikkbeta kinase compounds are useful for treating inflammatory disorders, e.g. asthma,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel antiinflammatory compound comprising membrane translocation domain fused to NEMO binding sequence, useful for blocking nuclear factor kappaB activation, and for treating asthma, lung inflammation,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         NEMO binding domain (NBD) peptides. The NEMO binding domains are found on IkappaB kinase-beta (IKKbeta) and IkappaB kinase-alpha (IKKalpha) proteins. The antiinflammatory compounds of the invention are useful for modulating nuclear factor-kappaB (NF-kappaB) induction in a cell, where the compounds are capable of blocking the interaction between one or more IKKs such as IKKalpha or IKKbeta, and NEMO. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to antiinflammatory compounds comprising

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        domain fused to NEMO binding sequence, useful for blocking nuclear factor kappaB activation, and for treating asthma, lung inflammation,
antinflammatory compound further comprises at least one membrane translocation domain. The compounds are useful for treating inflammatory disorders, autoimmune diseases, osteoporosis, cancer, Alzhaimer, e disease, atherosclerosis, viral infections, Ataxia telangiectasia, and for transplantation detection. The compounds of the invention block NF-kappaB induction by IKK but do not inhibit the basal activity of NF-kappaB. The present sequence represents a human mutant NBD peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel antiinflammatory compound comprising membrane translocation

compounds act as selective inhibitors of cytokine-mediated NFkappaB activation by blocking interaction of IkappaB kinase beta (IKKbeta) at the NEWO binding domain that results in inhibitino of IKKbeta kinase activation and subsequent decreased phosphorylation of IkappaB. The compounds are useful for treating inflammatory disorders, e.g. asthma, lung inflammation or cancer, psoriasis, rheumatoid arthritis, osteoarthritis, inflammatory bowel disease, sepsis, vasculitis, bursitis, autoimmune diseases such as lupus, polymyalgia, scleroderma, pranulomatosis, multiple sclerosis, transplant rejection; osteoporosis, Alzheimer's disease, atherosclerosis, viral infections, and ataxia telangiectasia. The compounds are also useful for treating pro-inflammatory responses such as allergies, urticaria, anaphylaxis, drug or food sensitivity, eczema, dermatitis, sunburn, aging and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Antiinflammatory; antiasthmatic; cytostatic; antipsoriatic; nootropic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel antiinflammatory compound comprising membrane translocation domain fused to NEMO binding sequence, useful for blocking nuclear factor kappaB activation, and for treating asthma, lung inflammation,
                                                                                                                                                                                                                                                                                                                                                                   Gape
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to an antiinflammatory compound (especially AAM48628-AAM48645), comprising a membrane translocation domain
                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                              Length 18;
                                                                                                                                                                                                                                                                                                                                                                   Indels
                                                                                                                                                                                                                                                                                                                            64.8%; Score 105; DB 23;

mino acid residues, fused to a MEMO binding sequence
(AAM48525-AAM48619). The antiinflammatory compounds have antiasthmatic,
cytostatic, antipsoriatic, antirheumatic, antiarthritic, osteopathic,
cytostatic, antipsoriatic, antirheumatic, antiarthritic, osteopathic,
contropic, antiatherosclerotic, virucide and antiallergic activity. The
compounds act as selective inhibitors of cytokine-mediated NFkappaB
activation by blocking interaction of IkappaB kinase beta (IKKbeta) at
the NEMO binding domain that results in inhibition of IKKbeta kinase
activation and subsequent decreased phosphorylation of IkappaB. The
compounds are useful for treating inflammatory disorders, e.g. asthma,
lung inflammation or cancer, psoriasis, rheumatoid arthritis,
osteoarthritis, inflammatory bowel disease, sepsis, vasculitis,
bursitis, autoimmune diseases such as lupus, polymyalgia, scleroderma,
cyaranulomatosis, multiple sclerosis, transplant rejection; osteoporosis;
Alzheimer's disease, atherosclerosis, transplant rejection; and ataxia
telangiectasia. The compounds are also useful for treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Caveolin, scaffolding domain, endothelial nitric oxide synthase, eNOS, vasodilation inhibitor; inflammation inhibitor; tumour cell angiogenesis; tumour cell proliferation, osteoporosis, arthritis; atherosclerosis; asthms; Alzheimer's disease, allergy, allergy chinitis; uticaria; anaphylaxis; dry sensitivity; food sensitivity; dermatitis; eczema; poriasis; sunburn, aging; osteoarthritis; psoriatic arthritis; lupus; spondylarthritis; chronic obstruction pulmonary disease; cancer; Cav; chronic inflammatory bowel disease; tumour growth; malignant neoplasm; human; fruit fly; antennapedia internalisation signal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          /note= "Control peptide based on a human caveolin-1 scaffolding domain shown in AAU79340 residues 82-101"

The invention describes an isolated caveolin scaffolding domain peptide (I). A fusion peptide (II) containing (I) and at least a membrane translocation sequence is useful for down regulating endothelial nitric oxide synthase (eNOS) activity in a cell, resulting in blockage of vasodilation. (II) is therefore useful for inhibiting inflammation and crumour cell angiquenesis/proliferation in an animal; and for blocking the interaction of caveolin with a protein in vivo. (II) may be useful in the interaction of caveolin with a protein in vivo. (II) may be useful in transment of inflammatory conditions such as osteoporosis, rheumatoid are also useful for treating pathological processes associated with a pro-inflammatory response including allergies such as allergic rhinitis, are uncorrectly as dermatitis, especially as dermatitis, espendylaxis, dry sensitivity, contaneous inflammation such as dermatitis, such as osteoarthritis, psoriatic arthritis, such as osteoarthritis, psoriatic arthritis, lupus, spondylarthritis, and chronic obstruction pulmonary disease and chronic inflammatory bowel disease. (I) and (II) are useful for replacing corricosteroids useful for immunosuppression in transplant and cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 patients. When administered along with one or more antiinflammatory agent (I) and (II) are useful for inhibiting tumour growth or malignant neoplasm including cellular angiogenetics, proliferation, invasiveness, and metastasis in biological systems. This sequence represents a fusion peptide of the invention created from the fruit fly antennapadia internallsation signal and control sequence Cav-X. based on the human caveolin-1 scaffolding domain shown in ANU79340, residues 82-101.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ò
                                                                                                                                                                                                                                                                                                                                                         The present invention relates to peptides capable of interacting with a Smad protein, comprising a Smad Interaction Motif (SIM, amino acid sequence PP(T/N)K). The present sequence is one such Smad interacting peptide. Smad proteins are a family of highly conserved, intracellular proteins that signal cellular responses downstream of Transforming Growth Factor-beta (TGF-beta) family serine/threonine kinase receptors. The SIM is thought to be necessary for interaction with the MHZ domain of Smad2. The peptides of the present invention are useful in the manufacture of a medicament for the treatment of a patient in need of modulation of activin or TGF-beta signalling; cancer; a patient in need of reducing extracellular matrix deposition, encouraging tissue repair and/or regeneration, tissue remodelling or healing of a wound, injury or surgery, or reducing scar tissue formation arising from injury or brain; a patient with or at risk of end-stage organ failure, pathologic extracellular matrix accumulation, a fibrotic condition, disease states associated with immunosuppression (such as different forms of malignancy, chronic degenerative diseases, and AIDS), diabetic nephropathy, tumour growth, kidney damage (for e.g. obstructive neuropathy, IgA nephropathy or non-inflammatory renal disease) or renal fibrosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

The present invention relates to peptides capable of interacting with a smad protein, comprising a Smad Interaction Motif (SIM; amino acid sequence PP(TVN)K). The present sequence is one such Smad interacting peptide. Smad proteins are a family of highly conserved, intracellular peptide. Smad proteins are a family of highly conserved, intracellular proteins that signal cellular responses downstream of Transforming Growth Excor-beta (TGG-beta) family serine/hreonine kinase receptors. The SIM is thought to be necessary for interaction with the MH2 domain of Smad2. The peptides of the present invention are useful in the manufacture of a medicament for the treatment of a patient in need of modulation of activity or TGF-beta signalling; cancer; a patient in need of reducing extracellular matrix deposition, encouraging tissue repair and/or regeneration, tissue remodelling or healing of a wound, injury or segeneration, reducing scar tissue formation arising from injury to the brain; a patient with or at risk of end-stage organ failure, pathologic extracellular matrix accumulation, a fibrotic condition, disease states associated with immunosuppression (such as different forms of malignancy, chronic degenerative diseases, and AIDS), diabetic nephropathy, tumour growth, kidney damage (for e.g. obstructive neuropathy, Igh nephropathy, or non-inflammatory renal disease) or renal fibrosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Alpha smooth muscle actin; alpha-SM; wound contraction; hypertrophic scar; fibromatosis; Dupuytren disease; fibrotic condition; lung fibrosis:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Polypeptide capable of interacting with a Smad polypeptide, useful in the treatment of canner and for tissue remodelling or healing of a wound, injury or surgery, comprises a Smad Interaction Motif and is less than 32 amino acids in length -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Use of papillomavirus E2 protein peptidomimetics for treating papillomavirus-infected cells and papillomavirus-induced conditions in mammals by inhibiting E1-E2 interaction
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes the use of a small organic compound (A) which competitively inhibits interaction of a papillomavirus (PV) E2 protein with a PV E1 protein for treating a cell infected with PV or a
                                                                                                                                                                                                                                                        The present sequence is a cell permeable anti-apoptotic protein blocking peptide, which can be used to inhibit tumour growth, e.g. by ex vivo purging or (after stabilisation) in vivo administration. The peptide preferably blocks Bcl-2, and comprises a signal peptide mediating cell penetration and a functional sequence corresponding to a Bcl-2 domain.
                                                                                                                                                                   Peptide(s) that block anti-apoptotic proteins - useful for

                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to novel peptides comprising of a specific tetrapeptide associated with an oligopeptide which allows the introduction of the tetrapeptide into the target cell. The present sequence is one such peptide. Residues 1 to 4 of the present sequence correspond to the oligopeptide. Residues 1 to 4 of the present sequence correspond to the oligopeptide. The specific tetrapeptide of the present sequence interferes with alpha smooth muscle (alpha-SM) actin organisation in stress fibers. The present sequence may be used in the prevention and/or treatment of a disease related to alpha-SM actin prevention, e.g. wound contraction, hypertrophic scars, fibromatosis and fibrotic conditions. The present sequence may also be used to treat bupuytren disease and lung fibrosis.
                                                                                                                                                                                                                                                                                               A peptidic product for prevention and treatment of a disease related to alpha-SM actin expression comprises a tetrapeptide associated with a chemical entity that is able to introduce the tetrapeptide into the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to novel peptide modulators of androgen receptor. The peptides of the invention are useful for treating androgen-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New peptide modulators of androgen receptor, useful for treating androgen-associated disorder, e.g. prostate cancer, particularly hormonally refractive prostate cancer, colon cancer, lung cancer, acne,
            cytostatic, antiproliferative and dermatological activities. Methods from the present invention can be used to treat PV-induced conditions including growth of PV preneoplastic and neoplastic lesions, cutaneous lesions chosen from warts and other benign cutaneous lesions, plantar warts (verruca plantaris), common warts (verruca plans), Butcher's common warts, flat warts, ganital warts (condyloma acuminatum) and epidermodysplasia verruciformis, laryngeal, oral, pharyngeal, oesophageal and other upper airway papilloma or vaginal, cervical, vulvar, penile and anorectal carcinoma. The E2 inhibitors may also be used to treat epithelial and internal fibropapillomas in animals. The present bequence represents a peptide sequence used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                Gaps

Sequence 6, Application US/08810540

Patent No. 5929042

GENERAL INFORMATION:

APPLICANT: Troy, Carol M.

TITLE OF INVENTION: ANTISENSE COMPOUNDS WHICH PREVENT CELL

TITLE OF INVENTION: DEATH AND USES THEREOF

NUMBER OF SEQUENCES: 7

CORRESPONDENCE ADDRESS:

ADDRESSEE: Cooper & Dunham, LLP
                                                                                                                                APPLICANT: Troy, Carol M.

Sequence 7, Application US/09072429
Sequence 7, Application US/09072429
Patent No. 5962415
GENERAL INFORMATION:
APPLICANT: Nadler, Steven G.
TITLE OF INVENTION: COMPOSITIONS COMPRISING A PEPTIDE
TITLE OF INVENTION: INHIBITOR OF NUCLEAR PROTEIN TRANSLOCATION AND TITLE OF INVENTION: INMUNOSUPPRESSANT AND METHODS OF USE THEREOF NUMBER OF SEQUENCES: 24
CORRESPONDENCE ADDRESS:
ADDRESSE: Bristol-Myers Squibb Company
STREET: P.O. Box 4000
CITY: Princeton
CITY: New Jersey
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   .

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               May MJ,
    The invention relates to modulating NF-kappaB (NF-kB) induction in a cell comprises contacting a cell with an anti-inflammatory compound (ABB08725) comprising at least one NEWO binding domain (ABB77313). The compound has acts through selective inhibition of (ABB08725) comprising the acts through selective inhibition of twick at the NEWO binding domain. Blocking the interaction of NEWO interaction results in inhibition of IKAGpa Kinase activation and subsequent decreased phosphorylation of IKAGpa Kinase activation and subsequent decreased phosphorylation of IKAGpa Kinase activation and subsequent decreased phosphorylation of IKAGpaB. The compound may also act (directly or indirectly) by blocking the recruitment of leukocytes into sites of acute and chronic inflammation, by down-regulating the expression of E-selectin on leukocytes or by blocking osceoclast differentiation. The compound is useful in treating NF-kB mediated conditions, where the condition is an inflammatory disorder and conditions, where the condition is an inflammatory disorder is asthma, allergies, urticaria, anaphylaxis, cutaneous inflammatory disorder is asthma, allergies, urticaria, anaphylaxis, cutaneous inflammation, seppis, psoriasis, chemacoid arthritis, osteoarthritis, psoriatic arthritis, lupus and bursitis. The inflammatory disorder may also be dermatitis, cromany associatic arthritis, lupus and spondylarthritis. Also for Crohu's giraniomary disease, ulcerative colitis, polymyalgia, scleroderma, Wegner's granulomatosis, temporal arteritis, suppolylarianis, or multiple sclerosis. For chronic viral infections croyoglobulinaemia or multiple sclerosis. For chronic viral infections croyoglobulinaemia or multiple sclerosis. For chronic viral infections crosused by Epstein-barr, cytomegalovirus or herpes simplex. Other viral and food sensitivity, contact dermatitis, and application in which corticosteroids are used, included in multiple and contact persections and influence. The infection or active and persection or repease include HIV and in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        antiinflammatory compounds and for diagnosis of an inflammatory disorder. The compound may be administered alone or in combination with other known anti-inflammatory agents. The present sequence is that of a mutated NEWO binding domain of IKKOeta.
                                                                                                                                                                                                                          Modulating NF-kappaB induction in a cell, useful for treating e.g. inflammatory disorders, osteoporosis and cancer, comprises contacting a cell with an anti-inflammatory compound comprising at least one NEMO

(AAM48525-AAM48619). The antinflammatory compounds have antiasthmatic, cytostatic, antipsoriatic, antirheumatic, antiarthritic, osteopathic, antibacterial, immunosuppressive, dermatological, neuroprotective, contropic, antiatherosclerotic, virucide and antiallergic activity. The compounds act as selective inhibitors of cytokine-mediated NFKappaB activation by blocking interaction of IkappaB kinase beta (IKKbeta kinase activation by blocking interaction of IkappaB kinase beta (IKKbeta kinase activation and subsequent decreased phosphorylation of IkappaB. The compounds are useful for treating inflammatory disorders, e.g. asthma, lung inflammatory bowel disease, sepsis, vasculitis, osteoarthritis, inflammatory bowel disease, sepsis, vasculitis, bursitis, autoimmune diseases such as lupus, polymyalgia, scleroderma, bursitis; autoimmune diseases such as lupus, polymyalgia, scleroderma, arangimenters disease, atherosclerosis, viral infections; and ataxia telangiectasia. The compounds are also useful for treating paphilay.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

(AAM48620-AAM48645), comprising a membrane translocation domain

(AAM48620-AAM48645), comprising a membrane translocation domain

(AAM48620-AAM48619). The antiinflammatory compounds have antiathmatic, antipactatic, antipactatic, antiinflammatory compounds have antiathmatic, antipactatic,                                                                                                                                                                                                                                                Antinflammatory; antiasthmatic; cytostatic; antipsoriatic; nootropic; antirheumatic; antiarthritic; osteopathic; antibacterial; virucide; immunosuppressive; derivatedogical; neuroprotective; antiatherosclerotic; antiallergic; membrane translocation domain; NEWO binding domain; eczema; cytokine; NFkappaB; IkappaB kinase beta; IKKbeta; cancer; psoriasis; rheumatoid arthritis; osteoarthritis; inflammatory bowel disease; autolmmune disorder; multiple sclerosis; transplant rejection; osteoporosis; Alzheimer's disease; atherosclerosis; viral infection; ataxia telangiectasia; allergy; anaphylaxis; arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel antiinflammatory compound comprising membrane translocation domain fused to NEMO binding sequence, useful for blocking nuclear factor kappaB activation, and for treating asthma, lung inflammation,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   pro-inflammatory responses such as allergies, urticaria, anaphylaxis, drug or food sensitivity, eczema, dermatitis, sunburn, aging and

```
The invention relates to an antiinflammatory compound (especially AMM48629-AMM48645), comprising a membrane translocation domain (AAM48620-AMM4862), comprising a membrane translocation domain characteristic and residues, fused to a NEMO binding sequence (AAM48525-AAM48619). The antiinflammatory compounds have antisathmatic, orticatatic, antipacontatic, antiheumatic, antiathriac, osteopathic, corpounds act as selective inhibitors of cytokine-mediated NFRappas compounds act as selective inhibitors of cytokine-mediated NFRappas compounds act as selective inhibitors of cytokine-mediated NFRappas cortivation by blocking interaction of Ikappas kinase beta (IKKbeta kinase cutivation by blocking interaction of Ikappas kinase beta (IKKbeta kinase cutivation by blocking interaction of Ikappas kinase beta (IKKbeta kinase compounds are useful for treating inflammatory disorders, e.g. asthma, lung inflammation or cancer, psoriasis, rheumatoid arthritis, osteopacenthatitis, inflammatory bowel disease, sepsie, vasculitis, costeopacentis, costeopacenthatics, antiple sclerosis; transplant rejection; osteoporosis; caranulomatosis, multiple sclerosis; transplant rejection; osteoporosis; callammatory responses such as lupus, polymyalgia, scleroderma, callammatory responses such as allergies, urticaria, anaphylaxis, arthritis; arthritis; anticallammatory responses such as allergies, urticaria, anaphylaxis, arthritis; arthritis; anticallammatory responses such as allergies, urticaria, anaphylaxis, arthritis; arthritis; anticallammatory responses such as allergies, urticaria, anaphylaxis, arthritis; arthritis; anticallammatory responses such as allergies, urticaria, anaphylaxis, arthritis; arthritis; anticallammatory dermatiiis, and ataxia arthritis; arthritis; anticallammatory dermatiiis, and ataxia arthritis; arthritis; and ataxia and ataxia arthritis; arthritis; and ataxia and ataxia arthritis; arthritis; and ataxia and ataxia arthritis; arthritis; and ataxia and ataxia arthritis; arthritis; and ataxia and ataxia arthritis; arthri
                                                                                                                                                                                     Antiinflammatory; antiasthmatic; cytostatic; antipsoriatic; nootropic; antirheumatic; antiarthritic; osteopathic; antibacterial; virucide; antirheumatic; antiarthricis; osteopathic; antibacterial; virucide; immunosuppressive; dermatological; neurological; neurocatic, membrane translocation domain; NEWO binding domain; eczema; cytokine; NFkappaB; IkappaB kinase beta; IKKbeta; cancer; psoriasis; rheumatoid arthritis; osteoarthritis; inflammatory bowel disease; autoimmune disorder; multiple sclerosis; transplant rejection; osteoporosis; Alzheimer's disease; atherosclerosis; viral infection; ataxia telangiectasia; allergy; anaphylaxis; arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel antiinflammatory compound comprising membrane translocation domain fused to NEMO binding sequence, useful for blocking nuclear factor kappaB activation, and for treating asthma, lung inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Findeis MA, Phillips K;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Claim 6; Page 62; 88pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to antiinflammatory compounds comprising NEMO binding domain (NBD) peptides. The NEWO binding domains are found on IkappaB kinase-beta (IKKDeta) and IkappaB kinase-alpha (IKKAlpha) proteins. The antiinflammatory compounds of the invention are useful for modulating nuclear factor-kappaB (NF-kappaB) induction in a cell, where the compounds are capbale of blocking the interaction between one or more IKKS such as IKKalpha or IKKDeta, and NEMO. The antiinflammatory compound turther comprises at least one membrane translocation domain. The compounds are useful for treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; antiinflammatory compound; NEMO binding domain; NBD; IKKbeta; IkappaB kinase-alpha; IKKalpha; NF-kappaB; nuclear factor-kappaB kinase-alpha; IKKalpha; NF-kappaB; nuclear factor-kappaB induction; inflammatory disorder; atheroscierosis; osteoporosis; cancer; Alzheimer's disease; atherosclerosis; viral infection; Ataxia telangiectasia; transplantation detection; immunosuppressive, osteopathic; cytostatic; nootropic; neuroprotective; antiatherosclerotic; virucide; vasotropic; antirheumatic; antiatheritic; mutant; mutein.

AMM48628-AAM48645), comprising a membrane translocation domain (APM48620-AMM48645), comprising a membrane translocation domain (AAM48620-AMM48645), comprising a membrane translocation domain amino acid residues, fused to a NEWO binding sequence and of AAM48620-AAM48650). The antiinflammatory compounds have antiasthmatic, cytostatic, antipsoriatic, antitheumatic, antiarthritic, osteopathic, antiatherosclerotic, virucide and antiallergic activity. The compounds act as selective inhibitors of cytokine-mediated NFkappaB compounds act as selective inhibitors of cytokine-mediated NFkappaB activation by blocking interaction of IkappaB kinase beta (IKKbeta) at the NEWO binding domain that results in inhibition of IKRbeta kinase activation and subsequent decreased phosphorylation of IKRpeBB. The compounds are useful for treating inflammatory disorders, e.g. asthma, osteoarthritis, inflammatory bowel disease, sepsis, vasculitis, osteoarthritis, inflammatory bowel disease, sepsis, vasculitis, creating inflections; and ataxia telangiectasia. The compounds are also useful for treating the treating infections; and ataxia telangiectasia. The compounds are also useful for treating pro-inflammatory responses such as allergies, urticaria, anaphylaxis,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to an antiinflammatory compound (especially AAM48628-AAM48645), comprising a membrane translocation domain (AAM48620-AM48651), comprising a membrane translocation domain (AAM48620-AM48621) which comprises from 6-15 amino acid residues, fused to a NEMO binding sequence (AAM48525-AAM48619). The antiinflammatory compounds have antiaethmatic, cytostatic, antipsoriatic, antiinflammatory compounds have antiaethmatic, antibacterial, immunosuppressive, dermatological, neuroprotective, anotropic, antiatherosclerotic, virucide and antiallergic activity. The compounds act as selective inhibitors of cytokine-mediated NFKAAppaB activation by blocking interaction of IkAppaB kinase beta (IKAbeta) at the NEWO binding domain that results in inhibition of IKAbeta kinase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        activation and subsequent decreased phosphorylation of IkappaB. The compounds are useful for treating inflammatory disorders, e.g. asthma, lung inflammation or cancer, psoriasis, rheumatoid arthritis,
                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel antinflammatory compound comprising membrane translocation domain fused to NEMO binding sequence, useful for blocking nuclear factor kappaB activation, and for treating asthma, lung inflammation,
drug or food sensitivity, eczema, dermatitis, sunburn, aging and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to an antiinflammatory compound (especially AAM46628-AAM46645), comprising a membrane translocation domain (AAM46628-AAM46645), comprising a membrane translocation domain (AAM48620-AMM48627) or AAM48646-AAM48651) which comprises from 6-15 amino acid residues, fueed to a NEWO binding sequence (AAM48525-AAM48619). The antiinflammatory compounds have antiasthmatic, cytosettic, antipsoriatic, antirhenmatic, antibacterial, immunosuppressive, dermatological, neuroprotective, nootropic, antiatherosclerotic, virucide and antiallergic activity. The
                                   bursitis; autoimmune diseases such as lupus, polymyalgia, scleroderma, granullomatosis, multiple sclerosis; transplant rejection; osteoporosis; Alzheimer's disease; atherosels; viral infections; and ataxia telangiectasia. The compounds are also useful for treating pro-inflammatory responses such as allergies, urticaria, anaphylaxis, drug or food sensitivity, eczema, dermatitis, sunburn, aging and arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gape
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       domain fused to NEMO binding sequence, useful for blocking nuclear factor kappaB activation, and for treating asthma, lung inflammation,

compounds act as selective inhibitors of cytokine-mediated NFkappaB activation by blocking interaction of IkappaB kinase beta (IKKbeta) at the NEWO binding domain that results in inhibition of IKKbeta kinase activation and subsequent decreased phosphorylation of IKKbeta kinase compounds are useful for treating inflammatory disorders, e.g. asthma, lung inflammation or cancer, psoriasis, rheumatory disorders, e.g. asthma, osteoarhritis, inflammatory bowel disease, sepsis, vasculitis, bursitis, autoimmune diseases such as lupus, polymyalgia, scleroderma, pranulomatosis, multiple sclerosis; transplant rejection; osteoporosis, granulomatosis, multiple sclerosis; viral infections; and ataxia telangiectasia. The compounds are also useful for treating pro-inflammatory responses such as allergies, urticaria, anaphylaxis, drug or food sensitivity, eczema, dermatitis, sunburn, aging and

Antiinflammatory; antiasthmatic; cytostatic; antipsoriatic; nootropic; antirheumatic; antiarthritic; osteopathic; antibacterial; virucide; immunosuppressive; dermatological; neuroprotective; antiatherosclerotic; antiallergic; membrane translocation domain; NEMO binding domain; eczema; cytokine; NFkappaB; IkappaB kinase beta; IKWbeta; cancer; psoriasis; rheumatoid arthritis; osteoarthritis; inflammatory bowel disease; autoimmune disorder; multiple soletosis; transplant rejection; osteoprosis; Alzheimer's disease; atherosclerosis; viral infection; ataxia telangiectasia; allergy; anaphylaxis; arthritis.
                          amino acid residues, fused to a NEWO binding sequence (AAW48525-AAW48619). The antiinflammatory compounds have antiasthmatic, cytostatic, antiinflammatory compounds have antiasthmatic, antibacterial, immunosuppressive, dermatological, neuroprotective, nootropic, antiatherosclerotic, virucide and antiallergic activity. The compounds act as selective inhibitors of cytokine-mediated NFkappaB activation by blocking interaction of IkappaB kinase beta (IKKbeta) at the NEWO binding domain that results in inhibition of IKKbeta kinase
                                                                                                                                                                                                                                                                                                             activation and subsequent decreased phosphorylation of IkappaB. The compounds are useful for treating inflammatory disorders, e.g. asthma, lung inflammatchion or cancer, psoriasis, rheumatchid arthritis, osteoarthritis, inflammatory bowel disease, sepsis, vasculitis, bursitis, autoimmune diseases such as lupus, polymyalgia, scleroderma, granulomatosis, multiple sclerosis; transplant rejection; osteoporosis; Alzheimer's disease, atherosclerosis; viral infections; and ataxia telangiectasia. The compounds are also useful for treating pro-inflammatory responses such as allergies, urticaria, anaphylaxis, drug or food sensitivity, eczema, dermatitis, sunburn, aging and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel antiinflammatory compound comprising membrane translocation domain fused to NEMO binding sequence, useful for blocking nuclear factor kappaB activation, and for treating asthma, lung inflammation,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Length 9;

The antinifiammetory compounds have antiaethmatic, Cytostatic, antipsoriatic, antinheumatic, antiarthritic, osteopathic, antibacterial, immunosupperssive, dermatological, neuroprotective, antibacterial, immunosupperssive, dermatological, neuroprotective, antibacterial, immunosupperssive, dermatological, neuroprotective, nootropic, antiatherosclerotic, virucide and antiallergic activity. The compounds act as selective inhibitors of cytokine-mediated NFKappaB activation by blocking interaction of IkappaB kinase beta (IKKbeta) at the NEMO binding domain that results in inhibition of IKAppaB. The activation and subsequent decreased phosphorylation of IKAppaB. The compounds are useful for treating inflammatory disorders, e.g. asthma, osteoarthritis, inflammatory bowel disease, sepsis, vasculits, osteoarthritis, inflammatory bowel disease, sepsis, vasculitis, bursitis; autoimmune diseases such as lupus, polymyalgia, scleroderma, cranaplant rejections; and ataxia telangiectesia. The compounds are also useful for treating creating or food sensitivity, eczema, dermatitis, sunburn, aging and

CAMAMABASS-AAMABG19). The antinflammatory compounds have antiasthmatic, cytostatic, antipoentatic, antihemmatory compounds have antiasthmatic, cytostatic, antipoentatic, antihemmatory compounds have antiasthmatic, antiboentatic, antihemmatory dermatological, neuroprotective, nootropic, antiatherosclerotic, virucide and antiallergic activity. The compounds act as selective inhibitors of cytokine-mediated NikappaB compounds act as selective inhibitors of cytokine-mediated NikappaB compounds are useful for treating inflammatory disorders, e.g. asthma, compounds are useful for treating inflammatory disorders, e.g. asthma, lung inflammation of IkappaB. The activation and subsequent decreased phosphorylation of IkappaB. The compounds are useful for treating inflammatory disorders, e.g. asthma, lung inflammation or cancer, psoriasis, rheumatoid arthritis, osteoarthritis, inflammatory bowel disease, sepsis, vasculitis, burstitis, autoimmune diseases such as lupus, polymyalgia, scleroderma, coranulomatosis, multiple sclerosis, transplant rejection; osteoporosis; Alzheimer's disease; atherosclerosis, viral infections, and ataxia telangiectasia. The compounds are also useful for treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         antirheumatic; antiarthritic; osteopathic; antibacterial; virucide; immunosuppressive; dermatological; neuroprotective; antiatherosclerotic; antiallergic; membrane translocation domain; NEMO binding domain; eczema; cytokine; NFkappaB; IkappaB kinase beta; IKKbeta; cancer; psoriasis; rheumatoid arthritis; osteoarthritis; inflammatory bowel disease; autoimmune disorder; multiple sclerosis; transplant rejection; osteoporosis; Alzheimer's disease; atherosclerosis; viral infection;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Antiinflammatory; antiasthmatic; cytostatic; antipsoriatic; nootropic;
Novel antiinflammatory compound comprising membrane translocation domain fused to NEMO binding sequence, useful for blocking nuclear factor kappaB activation, and for treating asthma, lung inflammation,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            pro-inflammatory responses such as allergies, urticaria, anaphylaxis, drug or food sensitivity, eczema, dermatitis, sunburn, aging and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gapa
                                                                                                                                                                                                                                                                                                                                           The invention relates to an antiinflammatory compound (especially AAM48628-AAM48645), comprising a membrane translocation domain (AAM48620-AMM48627 or AAM48646-AAM48651) which comprises from 6-15
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Length 9;

anino acid residues, fused to a NEMO binding sequence
(AAM4825-AAM48619). The antiinflammatory compounds have antiasthmatic,
cytostatic, antipostiatic, antirheumatory compounds have antiasthmatic,
antibacterial, immunosupressive, dermatological, neuroprotective,
compounds act as selective inhibitors of cytokine-mediated NFkappaB
compounds act as selective inhibitors of cytokine-mediated NFkappaB
activation by blocking interaction of IkappaB kinase beta (IKKbeta) at
the NEMO binding domain that results in inhibition of IKKbeta kinase
activation and subsequent decreased phosphorylation of IKKappaB. The
compounds are useful for treating inflammatory disorders, e.g. asthma,
lung inflammation or cancer, psoriasis, rheumatoid arthritis,
compounds are useful for treating inflammatory disorders, e.g. asthma,
lung inflammation diseases such as lupus, polymyalgia, scleroderma,
bursitis; autoimmune diseases such as lupus, polymyalgia, scleroderma,
cranulomatosis, multiple sclerosis; transplant rejection; osteoporosis;
Alzheiner's disease, atherosoflerosis; viral infections; and ataxia
telangiectasia. The compounds are also useful for treating
pro-inflammatory responses such as allergies, urticaria, anaphylaxis,
arthritis, anticultivity, eczema, dermatitis, sunburn, aging and
                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel antiinflammatory compound comprising membrane translocation domain fused to NEMO binding sequence, useful for blocking nuclear factor kappaB activation, and for treating asthma, lung inflammation,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to an antiinflammatory compound (especially AAM48628-AAM48645), comprising a membrane translocation domain (AAM48620-AMM48627 or AAM48646-AAM48651) which comprises from 6-15
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Claim 6; Page 62; 88pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The Inventor relates to an autonometry Compound of AMM48620-AMM48645), comprising a membrane translocation domain (AMM48620-AMM48645), comprising a membrane translocation domain (AMM48620-AMM48627) or AAM48646-AAM48651) which comprises from 6-15 amino acid residues, fused to a NEMO binding sequence (AAM48525-AAM48619). The antiinflammatcry compounds have antiasthmatic, ortostatic, antiathrematic, antiathrematic, antiathrematic, antiathrematic, ortospic, antiathrematic, virtude and antiallergic cactivity. The compounds act as selective inhibitors of cytokine-mediated NFkappaB activation by blocking interaction of IkappaB kinase beta (IKKbeta) at the NEMO binding domain that results in inhibition of IKAppaB. The compounds are useful for treating inflammatory disorders, e.g. asthma, lung inflammation or cancer, psoriasis, rheumatoid arthritis, osteoprosis, bursitis; autoimmune diseases such as lupus, polymyalgia, scleroderma, granulomatosis, multiple sclerosis, transplant rejection; osteoporosis, bursitis; autoimmune diseases such as lupus, polymyalgia, scleroderma, granulomatosis, multiple sclerosis; transplant rejection; osteoporosis; chung inflammatory responses such as lupus, polymyalgia, scleroderma, prelangiectasia. The compounds are also useful for treating pro-inflammatory responses such as allergies, urticaria, anaphylaxis, arthritis, includent of screems, dermatitis, sunburn, aging and
                                                                                                                                                                                                                                                                                          domain fused to NEMO binding sequence, useful for blocking nuclear factor kappaB activation, and for treating asthma, lung inflammation,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                               Novel antiinflammatory compound comprising membrane translocation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        invention relates to an antiinflammatory compound (especially
